

## Practice Exercise #49: Points and Lines II

[http://www.comp.nus.edu.sg/~cs1010/4\\_misc/practice.html](http://www.comp.nus.edu.sg/~cs1010/4_misc/practice.html)

**Reference:** Week 12 Lecture Exercise #2

**Date of release:** 3 November 2014

**Objectives:** Array of structures, sorting

### Task statement:

(This exercise is similar to Practice Exercise #45, except that instead of using two parallel integer arrays for the x- and y-coordinates, here you are to use an array of structures.)

You are given a list of points on a 2-dimensional plane, each point represented by its x- and y-coordinates, both integers.

You are to sort the points in ascending order of their x-coordinates, and for those points with the same x-coordinate, sort them in ascending order of their y-coordinates.

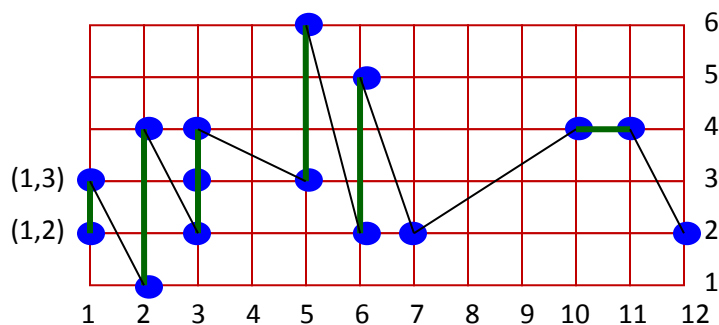

A structure type **point\_t** is to be used. It contains the members *x* and *y*, representing the x- and y-coordinates of a point. You are to store the points read into an array containing elements of such structure.

You may assume that there are at most 20 points and no two points are identical.

Do the sorting by calling Selection Sort only once. How do you adapt the Selection Sort code given in the lecture for this problem?

After sorting the points, imagine that you trace the points in their order in the sorted array. Write a function **traceLines()** to compute the sum of lengths of those lines that are horizontal or vertical.

For example, suppose this is the list of 15 sorted points: (1, 2), (1, 3), (2, 1), (2, 4), (3, 2), (3, 3), (3, 4), (5, 3), (5, 6), (6, 2), (6, 5), (7, 2), (10, 4), (11, 4), (12, 2). The diagram below shows the tracing of the points. The vertical and horizontal lines are marked in green. The sum of lengths of horizontal and vertical lines is 13.

**Sample run:**

Enter number of points: 15

Enter x- and y-coordinates of 15 points:

5 3  
2 4  
11 4  
3 2  
1 2  
10 4  
3 4  
6 5  
5 6  
3 3  
1 3  
6 2  
12 2  
7 2  
2 1

After sort:

Point # 0: (1,2)  
Point # 1: (1,3)  
Point # 2: (2,1)  
Point # 3: (2,4)  
Point # 4: (3,2)  
Point # 5: (3,3)  
Point # 6: (3,4)  
Point # 7: (5,3)  
Point # 8: (5,6)  
Point # 9: (6,2)  
Point #10: (6,5)  
Point #11: (7,2)  
Point #12: (10,4)  
Point #13: (11,4)  
Point #14: (12,2)

Sum of lengths of vertical and horizontal lines = 13
